Implement Client Script & UI Policy (Incident)

SCENARIO

Creating, testing, and deploying a Client Script and UI Policy on the Incident form

Entice

How does someone initially become aware of this process?

Enter

What do people experience as they begin the process?

Engage

In the core moments in the process, what happens?

Exit

What do people typically experience as the process finishes?

Extend

What happens after the experience is over?

Steps

What does the person (or group) typically experience?

- **Receive requirement** — Business asks to make Incident form fields dynamic
- **Open instance** — Developer logs in to the ServiceNow instance
- **Open Incident table** — Navigate to Incident > Open a record
- **Review form** — Check current form fields and behavior
- **Plan the logic** — Decide what needs a UI Policy vs a Client Script
- **Create Update Set** — Set a new Update Set so changes can be moved
- **Create UI Policy** — Define the condition on the Incident form
- **Add UI Policy Actions** — Set fields mandatory, read-only, or visible
- **Create Client Script** — Choose type (onChange) for the Incident table
- **Write script logic** — Add JavaScript to handle the field value change
- **Open Incident form** — Open a new or existing Incident to test
- **Change field values** — Update fields like Category or Priority
- **Verify behavior** — Confirm fields react as expected
- **Validate scenarios** — Test different roles and field values
- **Complete Update Set** — Mark the Update Set complete for migration
- **Document changes** — Record what was built and why
- **Monitor in use** — Watch how users work with the new behavior
- **Collect feedback** — Ask fellow admins and users what they think
- **Refine logic** — Adjust conditions or scripts as needed
- **Reuse elsewhere** — Apply the pattern to other tables

Interactions

What interactions do they have at each step along the way?

People: Who do they see or talk to?

Places: Where are they?

Things: What digital touchpoints or physical objects would they use?

- **Instance Home / Service Portal in the browser**
- **ServiceNow login page and Filter Navigator**
- **Incident > All list view and Incident form**
- **Incident form fields, sections, and Form Layout**
- **Notes, requirement doc, or Story record**
- **Email or ticket from business**
- **Update Sets > Local Update Sets in the Filter Navigator**
- **System UI > UI Policies > New in the Filter Navigator**
- **UI Policy Actions related list on the UI Policy**
- **System Definition > Client Scripts > New**
- **Script field in the Client Script form**
- **Incident > Create New in the Filter Navigator**
- **Incident form fields in the browser**
- **Browser console and Incident form**
- **Impersonate User for different roles**
- **Update Set record and Commit/Export options**
- **Documentation or knowledge article**
- **Incident list and reports**
- **Team chat, meetings, or feedback forms**
- **UI Policies and Client Scripts lists**
- **Other tables like Change or Problem**

Goals & motivations

At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")

- **Help me understand what the business needs**
- **Help me get into the instance quickly**
- **Help me find the right table**
- **Help me see what behaves wrongly today**
- **Help me choose the right tool for each need**
- **Help me keep my changes tracked**
- **Help me set conditions correctly**
- **Help me avoid breaking existing fields**
- **Help me pick the right script type**
- **Help me write clean, working code**
- **Help me test on a real Incident**
- **Help me try each condition**
- **Help me confirm nothing breaks**
- **Help me avoid missed edge cases**
- **Help me move changes safely**
- **Help me avoid confusion later**
- **Help me know it works for users**
- **Help me hear what to improve**
- **Help me improve without rework**
- **Help me save time on future work**

Positive moments

What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?

- **UI Policies can be built with no code**
- **Form behavior changes instantly on screen**
- **Client Script gives full control with JavaScript**
- **Seeing fields react is satisfying**
- **Successful test builds confidence**
- **Update Set makes migration simple**
- **Users find the form easier to use**
- **Pattern can be reused on other tables**

Negative moments

What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?

- **Hard to decide UI Policy vs Client Script**
- **Forgetting to set the Update Set first**
- **Script errors are hard to spot**
- **Conflicts with other scripts or policies**
- **Changes not visible until reload**
- **Extra time to test every role**
- **Missing edge cases cause issues**
- **Rework when requirements change**

Areas of opportunity

How might we make each step better? What ideas do we have? What have others suggested?

- **Ask for clear requirements in a template**
- **Keep a checklist of forms to review**
- **Make a decision guide for policy vs script**
- **Use UI Policy first when possible**
- **Keep scripts short and commented**
- **Use browser console to debug**
- **Prepare a test-case list per scenario**
- **Test with several user roles**
- **Check the Update Set before completing**
- **Gather user feedback regularly**
- **Standardize naming for scripts and policies**
- **Create a reusable template for other tables**
