Problem-Solution fit canvas 2.0

Implement Client Script & UI Policy (Incident)

Team ID : SWTID-2026-4475

Define CS, fit into CC

1. CUSTOMER SEGMENT(S) — CS

Who is your customer?
i.e. working parents of 0-5 y.o. kids

- ServiceNow administrators and developers who customize the Incident form
- Service desk agents / fulfillers who log, update and resolve incidents
- End users and callers who raise incidents (Service Portal / email / phone)
- IT support managers who need clean, consistent incident data for SLAs and reports

6. CUSTOMER CONSTRAINTS — CC

What constraints prevent your customers from taking action or limit their choices of solutions? i.e. spending power, budget, no cash, network connection, available devices.

- Limited admin / developer access and change-approval rules on production instances
- Heavy client-side scripts slow down forms on weak networks and low-end devices
- Must work with existing ACLs, Business Rules, form views and mobile / portal UI
- Limited time and budget for custom development and testing; changes must be upgrade-safe
- Some teams have little JavaScript / scripting skill

5. AVAILABLE SOLUTIONS — AS

Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e. pen and paper is an alternative to digital notetaking

- **Manual checking:** agents follow guidelines from memory. Pro: no setup. Con: errors, inconsistent data
- **Business Rules / Data Policies (server-side):** Pro: strong enforcement. Con: feedback only after save, no dynamic form behaviour
- **Dictionary settings (mandatory / read-only):** Pro: simple. Con: static, cannot depend on conditions
- **Third-party form plugins:** Pro: quick. Con: extra cost, upgrade risk

Explore AS, differentiate

Focus on J&P, tap into BE, understand RC

2. JOBS-TO-BE-DONE / PROBLEMS — J&P

Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides.

- Make the Incident form dynamic: show / hide fields and set mandatory / read-only based on Category, Priority and State
- Validate data before submit (e.g. Short description, Caller, Resolution notes when State is Resolved / Closed)
- React instantly to user actions: auto-fill values, show alerts and field messages on change (onLoad, onChange, onSubmit)
- Reduce incomplete or wrong incidents and rework, and speed up incident logging

9. PROBLEM ROOT CAUSE — RC

What is the real reason that this problem exists?
What is the back story behind the need to do this job?
i.e. customers have to do it because of the change in regulations.

- The Incident form has many fields and not all are relevant in every situation, so it is cluttered and error-prone
- Static form configuration cannot react to user input in real time
- Validation done only on the server, after submit, gives late feedback
- No enforced standards leads to inconsistent, incomplete data that hurts SLA reporting and resolution time

7. BEHAVIOUR — BE

What does your customer do to address the problem and get the job done?
i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace)

- **Agents:** open or create an incident, fill fields, change State / Priority; they often skip fields or enter wrong values
- **Admins / developers:** analyse requirement, then create UI Policies (conditions and actions) and Client Scripts (onLoad / onChange / onSubmit) on the Incident table
- Test in a development / personal instance and move changes with Update Sets
- Indirect: read docs, follow tutorials, join ServiceNow community and share best practices

Focus on J&P, tap into BE, understand RC

Identify strong TR & EM

3. TRIGGERS — TR

What triggers customers to act? i.e. seeing their neighbour installing solar panels, reading about a more efficient solution in the news.

- Managers or audits find incomplete / incorrect incidents
- SLA breaches caused by missing information
- Process change, e.g. mandatory resolution notes on closing

4. EMOTIONS: BEFORE / AFTER — EM

How do customers feel when they face a problem or a job and afterwards?
i.e. lost, insecure > confident, in control - use it in your communication strategy & design.

- **Before:** frustrated, confused, overwhelmed by a cluttered form, unsure what to fill
- **After:** confident, in control, guided by the form; less rework and more trust in the data

10. YOUR SOLUTION — SL

If you are working on an existing business, write down your current solution first, fill in the canvas, and check how much it fits reality.
If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer behaviour.

Configure on the Incident table:

- **UI Policies** make fields mandatory / read-only / visible by condition (e.g. State = Resolved makes Resolution code and notes mandatory)
- **Client Scripts** onLoad: set defaults, hide fields; onChange: react to Category / Priority / Caller; onSubmit: validate and stop save with a message
- Result: a dynamic, guided, error-free Incident form with no page reload

8. CHANNELS of BEHAVIOUR — CH

8.1 ONLINE

What kind of actions do customers take online? Extract online channels from #7

- Log in to the ServiceNow instance, open Incident form / list, create and update records
- Search ServiceNow docs, Developer site, community forums and video tutorials

8.2 OFFLINE

What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.

- Discuss requirements with the support team, managers and stakeholders in meetings
- Attend trainings / stand-ups; use checklists and process notes; peer review to gather feedback

Extract online & offline CH of BE
